Dear Hiring Manager,

I am writing this letter to apply for fresher Django web developer position. Also, enclosed my resume for this job position.

The role is really appealing to me and I believe that with skill I have learned and practiced in my training project will make me highly suitable for this position. Also, my strength will support me to succeed in this position.

In fact, my major is in electrical engineering for four years and without holding a computer science degree but I found my passion for programming and I seriously decided to pursue career as a software engineer. Last year, I had spent all my after work times and weekends for learning programming in Khoa Pham Training Center, because of my interest in programming and determination to get a web developing job.

As explained previously, I have attended two courses for web developer first for basic front-end skills and second for back-end web developing techniques using PHP and Laravel framework in Khoa Pham Training Center where I completed the practical projects for each course and applied knowledge and techniques learned from the senior web developer who is teachers of this center. Besides, I am learning by myself Python language and Django framework that really support for the web developing work.

I will also start to learn post graduated academic course in Ho Chi Minh University of Technology in this March and to get admission to course of university, I have been tested fundamental data structure, basic algorithm, programming and discrete math by the entrance tests, which are essentially required for software engineering major.

So, despite the lack of experience and computer science background, I believe that I also make some certain proper preparations of skills and necessary knowledge that will help me to quickly familiar with this work. I really look forward your response and if possible, I hope to have opportunity to be interviewed for this job position.

Sincerely,

Pham Dang Khoa
